

The way Medical Stuff works:
BANumber = business arrangement number, this is a unique billing number assigned to 1 clinic, hospitals do not need them.
Hospital Identifier = is an 8 digit code hospitals have which is usually in the format ##***** (usually province + 6 numbers)
Practitioner ID = is the identifier physicians are given when they register to practice in a province.
RNNumber = Registered Nurse ID, same idea as practitioner ID
healthCardNum = pretty self explanatory
prescriptionCode = if you have a prescription anywhere it should have an ID which is used for refills, that is used in this system for sorting
